PRODUCT DESCRIPTION

The most common problem with asphalt tennis courts is cracking. Cracking is caused, in part, by asphalt's natural tendency to shrink as it weathers and ages. In addition, asphalt loses its flexibility and becomes more brittle over time. Since outdoor tennis courts are also exposed to temperature extremes that cause expansion and contraction, cracking is inevitable almost without exception. Quality design and construction may minimize or delay cracking but it cannot completely eliminate it. Once cracks appear, it may be impossible to repair their cause, **but it is not impossible to repair the cracks themselves with the ARMOR® Crack Repair System.**

The **ARMOR® Crack Repair System** utilizes a knitted fabric that will expand as the crack widens. The secret to making this repair work is how it is purposely NOT bonded to the court in the vicinity of the crack, thereby allowing more of the fabric to absorb any movement or growth of the crack without the fabric tearing or delaminating from the surface. Thus, the reason why the **ARMOR® Crack Repair System** works so well is that it effectively spreads the stress of the crack over a wide area of expandable fabric—other brand name repair “systems” do not do this.

Although your tennis court is technically still cracked, the filled cracks are hidden beneath our repair and then covered over completely with color-coating materials. Although it will not prevent cracks from developing elsewhere on the court, or prevent cracks from growing in length out beyond the repair, the **ARMOR® Crack Repair System** successfully keeps repaired structural cracks from reappearing on the surface. There are some limitations and not all cracks are repairable with our product, so talk to your contractor about your specific court.

Most contractors simply install crack filler or put fiberglass fabric over the cracks. Almost without exception, both of these very common repair techniques will fail within one year, thus wasting both time and money. By using the **ARMOR® Crack Repair System**, your investment will last much longer than one season. See our brochure detailing up to 14 years of longevity.

There is not a crack repair system in the world for tennis courts that has achieved the success of the **ARMOR® Crack Repair System**. Since 1993, it has effectively kept structural tennis court cracks from reappearing, proving itself in a wide temperature range from below 0⁰F to above 100⁰F. In fact, our success has spawned some imitators. They claim to be “just as good,” but their short histories cannot compare to **ARMOR®**'s decades of proven, worldwide achievements. In fact, **ARMOR®** has sold more crack repair than all of our competitors combined. Don't be fooled by clever marketing claims. These impostors can try to copy our product, but they cannot copy our success. Insist on the original; insist on the best; insist on **ARMOR®**.
